LAND & LEDGERS

CANONICAL PROJECT BIBLE — CONSOLIDATED EDITION 1

STEP 04 ENHANCED VERIFICATION DRAFT • PROVISIONAL

Prepared: 8 October 2026

Primary gameplay source: Canonical Project Bible Revision XXXI (7 October 2026), including its preserved earlier layers

Technical compatibility reference: Technical Implementation Bible Revision XIV

Supplemental evidence: Occupation, Demography & Workforce Calibration (25 September 2026); Historical Work, Construction & Infrastructure Calibration (5 October 2026)

Review status: Step 04 augmented draft with targeted omissions restored; comprehensive clause-level no-loss certification remains open

Rule identity scheme: CAN-CE1-xx.y in this draft; final numbering and release identity remain provisional.

> **Authority notice.** This is a consolidation DRAFT, not a replacement for Canon XXXI. Original source PDFs remain preserved and authoritative until complete clause-level no-loss verification is achieved. It intentionally removes repeated revision wrappers, preserves current gameplay intent and routes detailed historical observations into separately planned reference documents. The fact that a passage is summarized here is not a claim that its original detailed constraints have been fully verified; Step 04 exists to close that gap.

How to read and review this draft

*Canon rules** determine intended gameplay and player freedoms. The Technical Bible will later determine state authorities, interfaces, persistence and test design; repository inspection, not documentation, proves existing Unity implementation.

*Current beats superseded.** An older canonical phrase appearing in a preserved source may be obsolete, especially where 1880 replaces 1870, jobs behave like classes, business types grant permissions or projects advance via abstract timers; this draft follows the more recent applicable rule.

*A name never supplies a missing resource.** A business, job, town, transport route, school, bank or building label is descriptive and does not create workers, equipment, customers, materials, legal rights or capital.

*Legal versus possible.** Distinguish what is physically possible from what is lawful and from what another Person will agree to perform. Existing Canon explicitly contemplates intentional unlawful conduct in appropriate cases; it does not authorize the simulation to award consequence-free immunity.

*Approval boundary.** Proposed changes 001–105 are approved design direction. Proposals 106–145 remain pending and are NOT independently adopted through this edition. Where an underlying principle already appears in Canon XXXI, it is preserved on that earlier authority, not promoted because the pending list happens to repeat it.

*Historical data.** Numeric playtest output, wages, commodity prices, mortality assumptions, flock thresholds and construction-rate envelopes are evidence or calibration until a specifically identified gameplay rule adopts a requirement. A period example is never a universal world constant.

Part I — Vision, player freedom and campaign structure

CAN-CE1-01.1 Identity and historical frame

Land & Ledgers is a realism-first, systems-driven frontier commercial and ownership simulation. Its normal Open Frontier historical envelope begins in **spring 1870** and extends to **1905**; authored scenarios may start later, end earlier or focus on a narrower geography or industry. The earlier spring-1880 base wording is superseded. The world is not a primitive technological blank slate in 1870: established hand, animal, water, wind and steam technologies already exist, while their local availability, finance, transport and support networks vary. The player may begin as an owner-operator, become an employer, manage a group of enterprises, hold portfolio capital, develop infrastructure or eventually delegate virtually every ordinary task. There is no imposed optimal business sequence.

CAN-CE1-01.2 Three production standards and five realism checks

Every intended mechanic must survive historical plausibility, economic plausibility, social plausibility, lifecycle plausibility and gameplay tolerance. The standing design filters are historical accuracy, genuine player freedom and a premium systemic experience. A physically and economically plausible decision is generally allowed to be unwise, unprofitable, badly timed or strategically ruinous; do not ban it merely because the designer expects it to fail. Conversely, physical limitations, contractual obligations, real legal restrictions, knowledge gaps, worker agency and other people's decisions must have meaning. Research unclear history before promoting speculation to certainty. Complexity should preserve important causal relationships while abstracting needless repetitive inputs.

CAN-CE1-01.3 Cause and consequence over modifiers

A crop failure removes harvest or capacity; scarcity, purchases, debt and local pricing then react. A bridge improvement changes route geometry, crossing reliability, loads and available journeys; no FreightBonus is applied simply because the bridge exists. A new manager improves outcomes through better actual decisions rather than a ManagementEfficiency stat. An advertising campaign changes who hears and responds rather than granting blanket sales. Vertical integration works only because actual internal labor, output, storage or transport replaces an outside transaction. Aggregate market, prosperity, business-health and reputation descriptions are useful read models, never primary economic events.

CAN-CE1-01.4 Failure, risk, game modes and victory

Commercial Ruin is a genuine strategic condition when reasonable recovery avenues have been exhausted, not a single negative-cash or negative-profit threshold. The player can lose a contract, property, worker, claim, route, credit facility, line of business or individual settlement opportunity without the game declaring immediate total defeat. Open Frontier is not forced into victory by a calendar date; scenarios may use dated, binary accomplishments and optional maintained conditions. Major historical or authored objectives are observations of the world, not engines creating the required customers, firms or resources. Player and NPC competitors face the same classes of ordinary opportunity, constraint and risk.

Principal source trail: CAN XXXI PDF pp.1–3, 7–8; CAN XXV section pp.72–82; Canon XIV Part I pp.240–252; Technical XIV pp.1–2.

Part II — Source-of-truth economy and commercial identity

CAN-CE1-02.1 One ordinary Business identity, composed activity

Create Business establishes one economic/legal Business identity, governance and the relevant ledger relationship; it does not require selecting General Store, Blacksmith, Construction Company, Ferry Company, Pharmacy or another hard permission class. Capabilities emerge from actual Persons, stock, tools, buildings, usable space, legal/contractual relationships, transport access, finance, time and trade. A firm can simultaneously manufacture, repair, retail, lease property, provide meals, haul, store cargo, cross a river or supply financial services where each operation is in fact supportable. Descriptive BusinessOperation, tags, industry names and setup templates aid UI, reporting and initial configuration only. Renaming or deleting a label must not remove a physically possible action.

CAN-CE1-02.2 Identity, status and operation are separate

Formation is not opening. A finished building is not an operating business; rented space is not an employee; an open business is not automatically profitable. Business forming, capable-but-not-trading, operating, suspended and closed are descriptions derived from necessary resources, current activities, access, authority and commerce, not effects caused by a hidden business-type or Capability=true flag. Owners may pause a line, add adjacent service, change assortment or combine activities without making a fresh Business. A temporary loss of cash or capacity is not always dissolution; formal closure, liquidation, reorganization and sale have distinct consequences.

CAN-CE1-02.3 Economic authority does not collapse into portfolio UI

A Business, an owner, a household, a partially owned corporation, an estate and an external financial institution are not one bank account. Business cash, owner cash, corporate treasury, deposits owed to others, receivables, debts and restricted/committed cash classifications remain meaningfully separate. Grouping several firms as one enterprise or division is administrative; a true merger needs actual transfers, assumption/consent of agreements and obligations, employee transitions, predecessor history and changed title/control. Shared ownership does not permit creating consolidated profit by paying oneself through internal billing.

CAN-CE1-02.4 Events, books, reports and valuation

An economic event records what occurred: product delivered, money paid, work completed, debt incurred, asset transferred or loss realized. Books may be absent, stale or mistaken without rewriting the underlying event. Reconciling a ledger requires correction evidence rather than silently replacing history. Separate exact known transaction facts from forecasts and appraisals. Business value, gross enterprise value, owner's equity, book basis, supported transferable market estimate and realized sale proceeds are different facts. An asset appreciating on paper is not cash or sale revenue. A manager report may compress many facts but cannot become a competing authoritative balance.

CAN-CE1-02.5 Rights and roles are specific

Ownership, custody, occupancy, leasehold, security interest, management, employment, membership, supplier priority, easement and representation create distinct obligations and powers. A landlord may own the building but not the tenant's business, stock or accounts; a corporate officer may direct authorized expenditures but does not personally own corporate cash. Customer-owned materials being stored or processed must not become ordinary purchased stock. Business-to-business obligations belong to the actual counterparties. Genuine legal institutional differences can constrain transactions independently of the firm's descriptive industry label.

Principal source trail: CAN XXXI pp.1–3, 7; CAN XXX pp.10–16; CAN XXIII pp.95–107; CAN XIV pp.259–264, 302–305; Technical XIV pp.1–2, 9–10.

Part III — People, persons, relationships and time

CAN-CE1-03.1 Persistent Personhood

People are not anonymous traffic particles, vacancy fillers or headcount purchased by a business. Each represented Person has persistent identity, time, age/lifecycle, household and kin links, health, location, economic roles, knowledge, experience and relevant personal history. A change of employer, residence, occupation, health, assets or jurisdiction must preserve identity and the economically meaningful past. A household, institution or Business can direct or fund an activity, while a particular Person actually travels, works, communicates or buys. Off-map representation may lower detail but does not manufacture or delete a person's identity.

CAN-CE1-03.2 Work is a capability/action, not a class unlock

Occupation is a readable summary of livelihood, history and likely fit, not a hard character class. Skill, aptitude, experience, domain familiarity and observed evidence are distinct. A teamster may load, repair, handle animals, negotiate freight and operate a small shop when competent and properly equipped; a carpenter can build, repair or supervise subject to actual task requirements. Ordinary production and repair can generally be attempted even by novices where the method and physical prerequisites exist, with duration, failure, injury, waste, supervision and output quality affected by competence. Truly impossible or specialist-sensitive tasks retain genuine underlying constraints rather than progression labels.

CAN-CE1-03.3 People decide whether they perform work

Feasibility of a task is separate from an employee's willingness and contractual obligations. A Person can accept, refuse, negotiate, leave, abandon, request assistance, report unsafe conditions or pursue another job. Agency depends on actual compensation, need, obligations, dangerous conditions, commute, relationship, fatigue, family duty, credible alternatives and available information. Good pay may not overcome unsafe work or domestic obligations; unwillingness does not mean the work method itself is impossible.

CAN-CE1-03.4 One time budget and realistic staffing

Employment scheduling, travel, sleep, care, family enterprise labor, domestic work, shopping, education, illness and civic participation draw on the same Person's available time. One worker may cover many task families sequentially, but cannot occupy different sites or perform incompatible tasks simultaneously. Workload comes from actual concurrent transactions, production, unloading, keeping records, service requests, maintenance and management demands, not prescribed job slots per Business type. Family and household labor are real finite work even if no separate market wage is paid; family/work relationships need not be recoded as a conventional payroll transaction. Training, apprenticeship and experience require real learning work and elapsed time, not instant level advancement.

CAN-CE1-03.5 Labor market and personnel evidence

Hiring begins from people that can actually be approached through known contacts, referrals, advertisement, messenger, newspaper, mail, telegraph or other legitimate channel; a button must not present an omniscient global candidate sheet. A Person's recorded jobs, statements, observations, work products, references and rumors yield varying confidence; hidden aptitude or future retention remains unknown. Offers establish real terms (pay, duties, schedule, board/housing, start, authority, commitments); response and information exchange consume time. Employers compete via wages, conditions, housing, hours, prospects, continuity and reputation from actual treatment. Losing one critical qualified operator can matter more than losing an interchangeable worker.

CAN-CE1-03.6 Fatigue, care, households and consequences

Long hours, poor sleep, travel, nutrition adequacy, household care, injury and sickness can create reduced availability or specific errors rather than a generic universal sick or morale percentage. Responsibility for children, older kin, disabled dependents and household production is assigned from actual circumstances, not blanket gender stereotypes. A wage-free spouse or adult child helping the shop cannot be in two places at once. Worker retention and household resilience arise from relationships and options, not a permanent loyalty bar.

Principal source trail: CAN XXXI pp.2–5; CAN XVII system audits pp.157–201; CAN XXIII pp.95–107; CAN XIV pp.285–296; OCC report pp.1–18. The 112 occupation profile list remains a supplemental classification suggestion, not a Canon permission catalogue.

Part IV — Households, accommodation and migration

CAN-CE1-04.1 Household, kin and residence remain separate

A Household is an economic/domestic unit, not a synonym for house, nuclear family or address. Parent-child and spouse relationships do not force shared residence; unrelated boarders can live together without merging finances or kinship. The normal relationship is Person → Household → Residential Occupancy → Accommodation Space → Building/Shelter → Parcel. A Person may relocate, board elsewhere or marry while retaining stable identity. Birth and death affect real Persons; marriage, household split/merger, guardianship and estate matters change relationships instead of generating or consuming free population counts.

CAN-CE1-04.2 Housing is suitability, not a universal quality tier

Owner occupation, renting, lodging, boarding, shared rooms, kin hospitality, employer accommodation, camps and precarious shelter are arrangements, not linear upgrade levels. Space provides actual shelter, sleep capacity, privacy, warmth, cooking, storage, water, sanitation, safety and access. Suitability is evaluated for a particular household in a particular season at a price it can afford. Emergency crowding can occur with costs, risks and eventual motivation to leave; a vacant single-person bunk does not solve a family-housing shortage. Rent is a contract rather than a floating instant spot price imposed on an occupied household.

CAN-CE1-04.3 Migration is an informed commitment and physical journey

Migration arises from employment, business possibilities, kin, land, public information, contracts and hardship, then requires knowledge of the opportunity, a choice, realistic travel, accommodation and eventual stabilization. An empty new house does not spawn a new family. A laborer may move first while family follows; a family may refuse a wage offer because no suitable housing exists. Temporary miners, rail crews and travelers alter daytime/transient demand without all becoming permanent residents. A boom can build camps before houses and services, or collapse leaving vacancies and debt. Population and labor-market read models distinguish residents from transients and reachable rural population.

CAN-CE1-04.4 Consumption and domestic work

Consumption arises from household people, reserves, income/cash/credit, preferred goods, affordability, urgency, season, travel and information, not an abstract population sales multiplier. Need, willingness and purchasing power are separate. Food, heating fuel, water, clothing, medicines, schooling and lodging consume actual resources; household production and family help also consume actual work. Merchant credit shifts timing and risk rather than creating income. A household can endure, downshift purchases, negotiate arrears, move, seek work or use kin support as actual circumstances permit.

CAN-CE1-04.5 Continuity after death, displacement and loss of guardianship

When an adult dies, disappears or is incapacitated, kinship, dependents, household membership, residence, employment and estate ownership remain persistent and separately resolvable. Dependents may require guardianship or temporary care; moving a dependent into another home does not automatically transfer inherited property or erase historical identity. Death is not a command to invent a new household of replacement Persons.

Source trail: CAN XXX pp.17-19; preserved CAN XIV household lifecycle; TECH XIV preserved population guidance.

Principal source trail: CAN XVII system audits pp.157–201; CAN XXIII pp.95–107; CAN XXX pp.10–20; CAN XIV pp.285–296, 341–342; Technical XIV pp.9–10.

Part V — Land, parcels, buildings and real estate

CAN-CE1-05.1 Geography is partly fixed and partly emergent

The historically meaningful skeleton—major rivers, regional market centers, broad terrain, treaty/reservation/federal geography, major rail approaches and governmental chronology—must respect the scenario's historical envelope. Local roads, plausible towns, farmsteads, ferry sites, enterprises and lesser projects may vary procedurally. A settlement's commercial character is an observed role such as river crossing, mine service center, rail-platted agricultural town or administrative node, not a universal TownLevel granting permissions. Infrastructure or geography makes activity more attractive or difficult through actual travel, access and costs.

CAN-CE1-05.2 Parcel, building, space and use are distinct

Parcels have title/legal status, survey facts, frontage, access, area, topography, water and development context. Buildings have condition, design, functional spaces and systems. FunctionalSpaces expose physical characteristics and suitability; a use relationship gives a Person or Business legitimate occupancy/operation rights. The commercial function of a building does not determine what kind of Business its occupant may operate. Mixed-use structures and shared buildings—including shop under living quarters, multiple independent tenants and flexible workshops—are normal where physically and legally feasible. Conversion requires actual work and costs where necessary, not a category-flip bonus.

CAN-CE1-05.3 Land and business acquisition are transactions with willing counterparties

An interesting parcel is not automatically listed or for sale. Offers can be made, but owners may refuse, negotiate, seek another buyer, doubt financing, demand speed, retain family land, require consents or have encumbered title. Discovery comes from owner contact, listings, agents, public/estate/creditor events, direct inquiry, investigation and local knowledge. Actions include purchase, lease, option, mortgage/security, easement, seller financing, parcel division, partnership or another historically supported arrangement. Auctions, tax sales, foreclosure and bankruptcy preserve their different rights, uncertainties and redemption possibilities.

CAN-CE1-05.4 Public land, rights, Indigenous geography and legal provenance

Visual emptiness is not ownership vacancy. Filing, claim, residence/improvement, proof, patent and transfer are different states; railroad grants, federal holdings, treaty/reservation boundaries and other legal interests constrain what can be acquired, possessed or developed. Land authority depends on dated jurisdiction and actual claims, not a homestead button that creates perfect fee-simple title. Indigenous communities, land rights and commercial

relationships require researched geography and historically respectful specificity; do not turn restrictions into a generic unclaimed-land pool.

CAN-CE1-05.5 Property operation and development

Landlords decide rents, improvements, maintenance, sales, building use and financing; tenants decide whether terms and spaces fit. Development requires site control, engineering or design as necessary, materials, contractors, labor, finance, work, usable completed spaces, recruitment and actual occupancy. Vacancy, bad access, expensive debt and uncertain future demand should inhibit further building through real economics. The same owner can operate multiple properties, sell some, lease others or authorize managers to pursue eligible sites within governed spending and financing boundaries.

CAN-CE1-05.6 Public land and Indigenous geography remain distinct

Federal public-domain land, railroad land, land under Indigenous treaty or reservation status, an unperfected private entry claim, a patented title, a leasehold and a disputed or encumbered private parcel are not interchangeable. A terrain tile that looks unoccupied does not prove it is legally available; claims and changes in control require the dated geographic/legal process, evidence and affected parties. Research precise jurisdiction and geographic chronology rather than treating all frontier territory as unrestricted market inventory.

Source trail: CAN XXIX pp.22-27; CAN XXV pp.72-76; CAN XXXI p.5.

Principal source trail: CAN XXXI pp.5–6; CAN XXV pp.72–82; CAN XXIX pp.21–37; CAN XIV pp.253–259, 326–330, 338; Technical XIV pp.4–5.

Part VI — Task execution, production, repair and projects

CAN-CE1-06.1 A common work grammar

Work begins when an economic or physical need exists. A ProductionMethod or service/work method describes inputs, equipment, space, prerequisites, work sequence, labor/time, tolerances, outputs, byproducts, failure and rework. Tasks consume actual Person and equipment availability and advance on the authoritative continuous clock; independent work fronts can proceed concurrently where resources permit. Methods are connected to objects and work, not granted by shop or occupation class. Plans, methods, execution, quality and completion have distinct evidence.

CAN-CE1-06.2 Stock production, made-to-order work and customer work

A Business may hold target stock, maximum stock, reserved inputs, make-to-order policy, customer-order priority, internal-project priority and other ordinary instructions. Those settings create scheduling choices, not output or magical throughput. One forge or saw cannot perform two incompatible jobs at once; purchased inputs and actual inventory must be present. A smith may manufacture nails for sale, repair a customer's tool and provide internal work, with the operator or manager deciding which commitment to fulfill first. If the customer owns the item under repair, its custody and return are not a sale of that item to the workshop.

CAN-CE1-06.3 Condition, diagnosis and repair

Durability is not one universal health bar. Machines, wagons, tools, animals, buildings and infrastructure have meaningful condition domains, faults, operating limitations and maintenance histories appropriate to each object. Wear is driven by actual workload, environment, storage and use. Inspections change knowledge; repair changes the asset. A failed task can generate delayed service, defect, rework, damage, injury, contaminated output, wasted stock or a new repair job as its domain warrants. A merchant or manager may defer maintenance and bear the consequences.

CAN-CE1-06.4 Projects are decomposed physical commitments

Construction and infrastructure are Projects containing meaningful WorkPackages, tasks, material requirements, workers, specialists, equipment and dependency chains. Completion of construction, physical usability, occupancy, commercial opening and profitability are distinct facts. A permanent new building cannot appear because its named prefab timer elapsed, and a contractor does not earn skill or access by completing an abstract ContractorLevel. Capability, resources, prior work, reputation evidence, financing, relationships and capacity influence winning and performing jobs.

CAN-CE1-06.5 Construction duration and contracting

Active task time, elapsed project time, lead/queue time and interruption time must not be conflated. Materials may require procurement and freight; a finished roof cannot precede its physical supporting work, and fast track laying on prepared grade is not the duration of the whole railway. Weather, season, soil, crews, labor mix, specialist access, change orders, inspections, accidents, rework and cash delays can change elapsed delivery. A builder may accept multiple overlapping contracts, self-perform, hire, subcontract, prioritize internal work or risk overcommitment; contract performance and actual work intervals matter more than signatures.

CAN-CE1-06.6 Construction claims, risk allocation and performance security

Contractor default need not erase completed physical construction: remaining work can be reassigned while defects, title, unpaid bills, claims and disputes persist. Liens, bonds, risk-of-loss clauses, public procurement, inspected acceptance, change orders and cure terms must be resolved under the applicable agreement and dated law. A performance bond creates contingent security, not instantaneous project completion.

Source trail: CAN XXVIII construction project integration p.46; Work calibration pp.5-7.

CAN-CE1-06.7 Work-package timing and project calendars

Meaningful construction estimates distinguish active labor or machine time, calendar time to usable/accepted completion, lead/queue delay and interruption time. Task quantities, parallel fronts, tool/material staging, weather, contractor scheduling, funding and rework determine elapsed completion; record-setting performances are not default rates. Project reporting should preserve planned active work, current elapsed forecast and actual elapsed result.

Source trail: WORK reference pp.2-3 and 15; CAN XXVIII construction integration.

CAN-CE1-06.8 Physical output under financial distress

A stalled or abandoned project retains survey, excavation, worksite, supplied materials, part-built structures, defective workmanship and legal claims that actually exist. Replacement contracts, financing, liquidation or rework consume or transfer that material state rather than restarting the project from a clean abstract percentage.

Source trail: CAN XXVIII construction integration p.46; CAN XXX 4.3.

Principal source trail: CAN XXXI pp.3, 5; CAN XXVIII pp.38–46; CAN XXII pp.108–112; CAN XIX pp.125–156; CAN XIV pp.259–264, 335, 339; WORK reference pp.2–16.

Part VII — Products, stock, purchasing and trade

CAN-CE1-07.1 A retail transaction needs a real offer

Retail arises from goods offered for sale by an actor with legitimate inventory/custody, price and terms, an accessible channel or location, adequate labor/time and any necessary legal requirements. Grocery, dry goods,

feed, hardware, books, farm produce and other merchandise are inventory assortments, not class-permitted lists. A storefront is one customer-facing arrangement; lawful sale may also occur at a market stall, workshop, landing, wagon, home, warehouse or rural producer site. Merchants may offer a broad mix while retaining one Business identity.

CAN-CE1-07.2 Supplier relationships are specific

Goods come from actual producers, wholesalers/jobbers, other local businesses, regional channels, own production or off-map sources with dates, price/terms, quantities, quality, transport responsibilities and lead time. Purchasing stock without an identified supplier/channel is not ordinary replenishment. Supplier terms can vary by product and customer relationship, including minimum quantity, bulk discounts, samples, deposits, credit, reserves, seasonal availability and delivery schedules. Local businesses and player-owned divisions do not receive free stock because they share ownership.

CAN-CE1-07.3 Inventory is physical and capable of aging

Stock belongs to a specific owner and occupies a physical location or legitimate in-transit/custody state. Quantities, lots, allocations, display/storage/bulk/cold capacity and reservations must reflect real goods, not a global warehouse abstract. Perishables can deteriorate, become unsafe, shrink, be wasted or be transformed by preservation; a new label or mixing with fresh stock does not reset their physical history. Quality and grade should carry the meaningful item-specific information required for pricing, use and provenance. Finished manufacturing and physical disposal change lots only through supported operations.

CAN-CE1-07.4 Demand, ordering and revenue remain distinct

An order, supply agreement, reserved stock, shipment, service booking and actual completed purchase are different facts. A household needing flour may fail to buy because of price, travel, credit, stockout, bad service or a better alternative. A business cannot treat unfilled demand as revenue. Sales may occur on account and create a receivable, not immediate cash. Returns, disputes, late deliveries and unacceptable quality preserve the actual agreement terms and work/stock consequences. Accounting must not reward a false sale or duplicate a delivered lot.

CAN-CE1-07.5 Barter, credit and exchange

Where period commerce supports it, a general merchant may accept eggs, produce, hides or another item in trade against other goods or a customer account, with real custody, valuation and resale/consumption consequences. Store accounts and supplier credit shift timing and default risk without minting money. Wholesale, retail, agent/consignment and own-production transactions must preserve which party actually earns a sale, pays a fee, carries stock risk or has a claim on goods. Packaging, handling, freight and finance influence landed and replacement cost.

CAN-CE1-07.6 Grain grading, elevator custody and warehouse receipts

Grain ownership, physical custody, measured grade, weight, storage charges, depositor claims and final sale are different facts. An elevator may buy grain outright or store grain for customers. Warehouse receipts can evidence a claim and, when applicable law supports it, be transferable or pledged; neither paper issuance nor movement within storage automatically creates an outright sale.

Source trail: CAN XXIX pp.27-29; CAN XIV p.207.

CAN-CE1-07.7 Commission sale, forwarding and consignment

A producer can consign physical goods or livestock to an agent or commission merchant who organizes transport, inspection, yard/storage handling, marketing and settlement for agreed fees. The agent's custody, selling authority, cash collections and owner compensation remain distinct from title and the gross sale price. A commission relationship improves access but cannot guarantee a higher price or a buyer.

Source trail: CAN XXIX p.89; CAN XXXI composed commercial identity.

CAN-CE1-07.8 Conservation, blocked shipments and authoritative settlement

Important inventory cannot be simultaneously restored to origin stock and retained as a separate loaded shipment; fulfillment and settlement must be supported by the same durable physical/economic events. A failed, partially fulfilled or blocked shipment must not count as completed delivery or qualifying provenance. This is an existing Physical Truth and ledger-integrity requirement; the specific known CreateBlockedShipment defect remains a P0 implementation follow-up, not a claim of repair.

Source trail: TECH XIV preserved Rev IV p.9; CAN XXXI 10.1; CAN physical freight doctrine.

Principal source trail: CAN XXXI pp.2–3; CAN XXVI pp.53–71; CAN XXIX pp.21–37; CAN XVII system audits pp.157–201; CAN XIV pp.265–268, 280–284; OCC pp.8–9.

Part VIII — Rural production, land use and biological economies

CAN-CE1-08.1 Farms are assembled physical enterprises

A farm is a combination of lawful land use and tenure, usable acreage and soil, weather/water, crops, seed, buildings, storage, draft power, tools, people, household labor, contracts, transport and finance rather than a FarmLevel. Owner operation, tenancy, share arrangements, family enterprise and hired work have different rights and costs. Seasonal crop and animal tasks compete for scarce people, field windows, equipment and transport. A farm can diversify, fail, lease equipment or hire custom services according to the same market logic as other enterprises.

CAN-CE1-08.2 Output is not free money

Growth, breeding, seed propagation, lactation, eggs, firewood, produce, wool, hides and similar physical outputs do not directly post owner cash or arbitrary mark-to-market profit. They may be consumed at home, stored, traded, processed or sold through ordinary events. Slaughter, processing, preservation, byproducts and disposal need material conservation. Product weight, grade, spoilage and preservation condition matter to what can be sold or delivered. Internal farm-to-store or farm-to-saloon supply still uses inventory, Person work, transport and agreed costs.

CAN-CE1-08.3 Animals have continuity

Working animals need feed, water, rest, appropriate tack/harness, handling, treatment and ownership identity. Health, age, condition, breeding and death influence productive capacity. Poultry in particular preserve source/parentage when relevant, fertility, incubation, hatch, juvenile growth, sex, laying/breeding allocation and eventual disposition. Non-laying males are not silently deleted; policy may retain, sell, slaughter or otherwise handle them. Exact fertility curves and optimal flock thresholds are not universal Canon numbers.

CAN-CE1-08.4 Specialized rural networks

Custom threshing, implement dealing, seed supply, feed milling, creameries, grain elevators, stockyards, livestock consignment, branding, estray recovery and field services emerge from equipment and real relationships. Grain

custody, grade, ownership, warehouse receipts, sale and transport are separable; an elevator can store someone else's grain or acquire it. Regional dealers and commission markets influence price/lead time without replacing physical production. Rural side-economies such as bone collection and timber extraction deplete finite resources instead of respawning forever.

CAN-CE1-08.5 Historical context over global modifiers

Drought, grasshoppers, hail, blizzard, long winters, livestock disease, market shifts and new machinery alter actual yields, survival, reserves, routes, prices, finance and replacement needs. One failed ranch should not mechanically shift the entire regional market unless its consequences plausibly propagate. Research crop calendar, soil, historic machinery and regional land/water practice before hard-coding their parameters.

CAN-CE1-08.6 Agricultural and livestock seasonality

Crop stages, pasture, winter forage, feed costs, animal condition, water, weather, transport, staffing and peak harvest work determine seasonal production and marketing choices. There is no universal monthly commodity-price bonus. Owners may retain, sell, breed, finish, process or stockpile goods as credible forecast, land use and working capital permit.

Source trail: CAN XXIX livestock commerce p.89; CAN XXV historical climate regime.

Principal source trail: CAN XXXI pp.6–7; CAN XXIX pp.21–37; CAN XXV pp.72–82; CAN XIV pp.268–279; Technical XIV pp.5–6.

Part IX — Craft, food, services, extraction and mining

CAN-CE1-09.1 Business depth comes from distinctive causal processes

An activity is worth being fully player-operable when it creates meaningful decisions about information, physical capacity, labor, input supply, products, customers, agreements, money, condition, time, authority and regional consequences—not merely because a historically named occupation existed. Distinct processes may reuse common work/transaction authorities rather than becoming bespoke minigames. A mixed workshop can repair wagon hardware, shoe horses, make farm tools and stock nails; its capacity comes from actual forge, labor, material and suitable method, not a BlacksmithBusiness licence.

CAN-CE1-09.2 Hospitality, boarding, saloons and concessions

Meals consume purchased or produced ingredients and food work; lodging uses real accommodation capacity, cleaning, heating, water, laundry and staff time. A saloon can sell drink and food, host poker, offer other lawful or intentionally unlawful period activity, rent gaming space or contract with an independent faro banker. Free poker has no direct gaming receipt unless actual fees/rake are agreed; faro exposes real bankroll risk and possible concession revenue. Independent entertainers, gamblers or service providers may be tenants/contractors rather than employees. Customer dwell, attraction, related purchases and nuisance consequences should emerge through Persons and transactions, not a SaloonSynergy modifier.

CAN-CE1-09.3 Processing chains preserve identity

A butcher buys or processes livestock, allocates usable cuts, offal, fat, hides, bones and other outputs, faces perishability and refrigeration constraints, and may sell retail or wholesale. Tanning is a separate time-consuming transformation; saddlery/leatherwork requires its own tools and skilled work. Bakery, dairy, milling, brewing, preservation and other processing use actual inputs, batches, equipment, work fronts, safety risks and lead time. A physical batch may change what it is while retaining source ancestry; a Business can be cash-starved during long work in progress even when a prospective sale is attractive.

CAN-CE1-09.4 Health, professional and knowledge services

A physician, midwife, nurse, dentist, druggist, veterinary specialist, barber, teacher, lawyer, surveyor, printer, reporter, assayer or agent supplies domain-specific work only where real skill, information, facilities, contracts and dated legality permit. Pharmacy can combine compounding/dispensing and ordinary retail; medical consultation can be run separately or together where rights and staff permit. Barbering does not automatically include dentistry. Education, investigation, legal drafting and medical care consume Person time and can produce better information or recovery without promising perfection or magical productivity.

CAN-CE1-09.5 Mineral rights and mines

Prospecting, claims, survey, assays, excavation, shaft/tunnel development, timbering, ventilation, dewatering, extraction, ore sorting, hauling, crushing, concentrating, smelting and sales are physically and financially distinct decisions. Mining work fronts may have different material grade, support, water and knowledge; knowledge from an assay does not reveal unexamined rock. High-grade/low-grade stockpiles, dumps, tailings, salvage and lease/investment arrangements can acquire new value as transport, treatment and price change. Claims, partial ownership, outside capital, service contracts, custom milling and mining supply can be separate opportunities without all requiring ownership of a producing mine.

Principal source trail: CAN XXXI pp.3–6, 8; CAN XXX pp.15–18; CAN XXIX pp.21–37; CAN XVII pp.157–201; CAN XIV pp.265–279, 297–301; Technical XIV pp.2–5.

Part X — Freight, transportation, rail, routes and communications

CAN-CE1-10.1 Transport as a connected physical system

Routes are actual terrain/rights/infrastructure connections with capacity, cost, season, grade, surface, crossings, tolls and operating services. Wagons, stagecoaches, ferries, riverboats, rail and local drayage can form multi-leg journeys. A transport contract does not create vehicles, teams, operators or a crossing. Important cargo remains located, owned or held in custody somewhere through loading, transit, transfer, unloading and acceptance. Coarse off-map movement may lower path detail but must preserve identity, time, cargo and legitimate transport economics.

CAN-CE1-10.2 Freight is not teleportation

An actual Shipment or Trip requires source, cargo, loading, available transport/handling, route or service, destination and unloading. Animals, workers, wagons, vessels and handling space are finite. A business can self-haul, pay a carrier, require pickup, charter service or subcontract under contract. Warehousing needs appropriate storage space, legal custody and handling capacity; calling a business a freight firm does not create unlimited storage. Contracts may overbook legitimately and result in delay or renegotiation, but unfulfilled shipments cannot magically count as physically delivered.

CAN-CE1-10.3 Rail development and service have distinct stages

A railway can be proposed, surveyed, financed, have rights-of-way, grading, rails laid, facilities built and an opened schedule—none of those states automatically imply the later ones. Rail segments may have different builder, owner, lessee, operator and controlling corporation over time. Operating depots, platforms, livestock pens, freight houses, water/fuel, warehouses, connections and stations are separate physical capabilities. Rail may capture long-haul traffic while increasing feeder wagon, farm collection, drayage and last-mile work. Industrial lines can precede general common-carrier services when economics justify them.

CAN-CE1-10.4 River, ferry and local transport survive network change

Ferrying, private river carriage, forwarding, passenger passage, drayage and livery require different equipment/people and may coexist in one Business. Navigation depends on seasonal ice, water stage, current, flood, wind, channel and vessel condition; an unusable river is not a flat winter revenue debuff. A small teamster can begin freight with a team, wagon, harness and supporting arrangements without building a warehouse. A business may charter river capacity before buying a vessel, gathering genuine demand and cost information rather than following an imposed transport tier ladder.

CAN-CE1-10.5 Technology is available, obtainable and supportable

Commercial invention date, regional availability, price, dealer/support network, local access, installation, skill requirements, power/fuel, spare parts and actual operation must be distinguished. A town need not pass an arbitrary TechnologyLevel to attempt a new machine, but an imported machine without fuel, parts or operators may be unproductive. Telegraph, postal service, newspaper, courier, telephone, road and rail transmit knowledge and goods with different costs and time; physical mail or message information must travel before actors react.

CAN-CE1-10.6 Period mail, catalog and parcel movement

Catalog trading and correspondence may extend merchant reach, with mail-order businesses operating within the campaign, but an order does not teleport goods or complete payment. Payment, order acceptance, freight/express carriers, rail/depot handling and collection or final delivery remain ordinary obligations. United States Parcel Post begins outside the normal 1870-1905 horizon and must not be projected backward into early local heavy-goods delivery.

Source trail: CAN XXV preserved p.77; CAN XXIX communication chronology.

Principal source trail: CAN XXXI pp.5–7; CAN XXV pp.72–82; CAN XXIX pp.21–37; CAN XIV pp.280–284, 306–311; WORK pp.8–15; Technical XIV pp.4–5.

Part XI — Settlements, markets, competition and economic pressures

CAN-CE1-11.1 Settlement growth derives from actual people and opportunities

Settlement population is based on real residents; daytime, transient, temporary-camp and rural-catchment measures serve different analyses. A handful of residents near a ferry or mine camp might support services because of passing teams, farmers and travelers; a larger isolated town may struggle. Roads, property, labor, accommodation, rural farms, market hubs and infrastructure alter reachable demand and firm viability. Settlement descriptors are role summaries, not automatic business lists or tier-based unlocks. A population chart must never post a transaction.

CAN-CE1-11.2 Customer choice and competition

Households, producers, employers and other buyers have real budgets, needs, relationships, information and alternatives. Price, quality, condition, stock, assortment, credit, travel, hours, reliability, service speed and delivery matter to their decisions. Customers can defect from the player and later return after evidence of improved conduct. Rival owners can invest well, misread demand, go into debt, lose staff, fail, acquire distressed businesses or control scarce sites under the same operating grammar. Rivals are not entitled to spawn merely to restore game balance.

CAN-CE1-11.3 Opportunity is interpretation of pressure, not a generator

Evidence can include refused sales, queues, poor housing match, insufficient freight capacity, idle equipment, lack of labor, vacant premises, changing margins, delayed orders, credit stress and outside-market prices. An

opportunity report compares unmet need, feasible responses, customer reach, competing firms and projects already in the pipeline. A shortage might be met by incumbent expansion, new firm, distant shipment, alternative product, migration or no profitable response. Saturation deserves its own interpretation from vacancy, low utilization, falling margin and unsold stock, not merely Shortage = false.

CAN-CE1-11.4 Dynamic feedback without scripted correction

Multiple builders or investors may independently construct for a shortage that disappears before completion, creating oversupply and distress. Prices move through actual output, buyer willingness, inventory and delivered cost. Price wars are ordinary purchases/sales at chosen terms and can reward customers or bankrupt overextended sellers. Closures release sites, labor, equipment and relationships; survival may depend on reserves, creditors, alternate products, expectations and willingness to continue. Neither prosperity nor failure is guaranteed by a town population trend.

Principal source trail: CAN XXXI pp.7–8; CAN XXVII pp.47–52; CAN XVII pp.157–201; CAN XIV pp.253–256, 297–301.

Part XII — Lending, finance, corporations and distress

CAN-CE1-12.1 Finance is an ordinary economy of obligations

Banks, private creditors, merchants, investors, mortgage lenders, loan/exchange/collection agents and outside financiers participate through instruments, accounts, relationships and dated powers. A new finance firm can lend its own money, arrange third-party credit, collect claims or provide permitted services without following a mandatory Loan Office → Bank tech tree. Taking public deposits creates obligations to depositors and material liquidity management; it does not enrich the owner personally. Financial legal forms and powers can differ genuinely by date, place and charter.

CAN-CE1-12.2 Credit is information-limited and lender-specific

Underwriting may consider borrower history, reputation evidence, collateral, existing encumbrances, purpose, projected repayment, character/relationships, industry, maturity, available lender funds, portfolio concentrations and other alternatives. A lender is not omniscient and may ask for records, guarantees, inspection, explanation or restrictive covenants. Appraisal value is not cash; high-value illiquid property does not automatically meet today's withdrawal or payroll bill. An undrawn credit facility is neither cash nor principal debt; drawing and repaying create corresponding changes. Credit terms remain dated legal and commercial matters, not a modern credit-score formula.

CAN-CE1-12.3 Capital and shareholder structures

Ownership percentage, voting control, dividend rights, governance, management authority, legal form and personal exposure must not be collapsed. Corporations hold their own assets, cash, debts, charters, shares and board/manager authority. Majority ownership does not allow unconstrained use of corporate funds for other personally owned enterprises, especially when minorities and creditors exist. Legitimate railway and related corporations may reinvest in traffic-supporting subsidiaries or development subject to charter, finance and governance. Equity dilution and sale consideration change actual ownership and proceeds, not a global empire score.

CAN-CE1-12.4 Buyouts, notes, pledges and guarantees

An employee, manager or outside purchaser may finance an acquisition through their own lender, with the seller paid cash at closing while separately retaining a contingent guaranty or collateral support when law/terms allow. Third-party borrower debt, retained seller debt, retained equity, collateral pledge, co-borrower status and

guaranty are different relationships. A seller with zero remaining equity may still be exposed as a guarantor. Liability arises or is enforced through contract triggers and proceedings; transfer of the Business does not erase surviving obligations. Seller and buyer preferences, certainty, speed, finance and competing offers matter.

CAN-CE1-12.5 Bank liquidity, confidence and failure

Bank loans are assets that tie capital; customer deposits are payable liabilities. Liquidity posture, maturity mismatch, correspondent balances, loan concentration and depositor behavior matter. Rumors may change behavior through information and existing liabilities; a bank run is accelerated real withdrawal demand, not a random confidence card. Recovery, suspension, asset disposal and creditor arrangements follow actual funds and law. A profitable institution may fail from liquidity shortage while owning valuable noncash assets; holding high reserves may reduce earnings but improve resilience.

CAN-CE1-12.6 Distress and debt continuity

Nonpayment can lead to negotiation, extension, added collateral, collection, bankruptcy where historically available, foreclosure, auction, receivership, partial salvage, liquidation or a sale. These are separate procedures with costs, delays, legal rules and counterparty choices. Distressed property may remain occupied, pledged or operational after enforcement begins. Commercial ruin considers remaining recovery choices rather than a universal automatic bankruptcy reset; modern bankruptcy mechanisms cannot be projected into periods when they did not exist.

CAN-CE1-12.7 Federal bankruptcy chronology

Bankruptcy rules are dated: there is a material gap without an operating federal bankruptcy system from 1878 until the federal Bankruptcy Act of 1898 took effect. During that interval, relevant state/territorial creditor remedies, negotiations, assignments, attachments, foreclosure and private liquidation may still operate. Later federal proceedings must not be represented as modern Chapter 7 or 11.

Source trail: CAN XXIX pp.30-32; CAN XIV historical finance appendix p.327.

CAN-CE1-12.8 Cooperatives, mutuals and pooled-capital institutions

Cooperative creameries, grain elevators, mutual insurance, financing and communication services arise where Persons or Businesses pool capital and accept real membership, governance, contributions, obligations and shared assets. A cooperative is an ownership/governance structure and operating relationship rather than a beneficial multiplier conferred by its label.

Source trail: CAN XXIX p.30.

CAN-CE1-12.9 Specific security and debt instruments

Chattel mortgages, real-property mortgages, unsecured merchant balances, notes, receivables, guarantees, corporate shares and pledges remain separate obligations and interests with identifiable parties and collateral. Enforcement depends on instrument terms, maturity, notice, applicable law and prior interests; one generalized Debt flag must not imply identical creditor power over all assets.

Source trail: CAN XXIX p.29; CAN XXI financing doctrine.

CAN-CE1-12.10 Multiple financial intermediaries

Banks, private lenders, merchants extending credit, note agents, building-and-loan associations, cooperatives and outside funders can coexist within the same catchment, each with their own instruments, information, capital, liquidity, governance and real legal authority. Lending and collection services need not follow a fixed institutional upgrade ladder.

Source trail: CAN XXIX p.29; CAN XXX pp.14-16.

Principal source trail: CAN XXXI pp.7–8; CAN XXX pp.14–16; CAN XXI pp.113–118; CAN XIV pp.302–305, 327–328; Technical XIV pp.9–10, 101 in preserved layer.

Part XIII — Delegation, information and commercial knowledge

CAN-CE1-13.1 The owner need not be the bottleneck

At the smallest scale a player may do physical labor and books personally. As commitments grow, a capable manager, foreman, general manager, clerk, bookkeeper, agent or supervisor can take work within actual authority, knowledge, time and competence. Managers and senior officials are roles rather than mandatory ladder ranks. One person can cover several units where travel/attention and competence permit, and an owner may deliberately manage zero ordinary businesses. Delegation does not multiply physical capacity or money.

CAN-CE1-13.2 Standing instructions and meaningful autonomy

A one-time order, ongoing manager-judgment mandate and persistent owner lock are different instructions. Manager judgment can adjust schedules, orders, hiring, small repairs, pricing, customer work, legal/contract compliance and other authorized actions through real tasks and transactions. Important purchases, borrowing, pledges, guarantees, major disposals and ownership changes may require explicit authority or escalation. Limits operate through permissions/agreements and reports, not generic invisible autoplay. Managers can be wrong and may produce bad consequences.

CAN-CE1-13.3 Visibility into what managers did

Delegated work should be inspectable through material decisions, source evidence, governing policy/authority, new financial or resource commitments, outcome, exceptions and unresolved choices. Owner attention emerges from a manageable stream of actual matters needing judgment, not an AttentionPoints currency. Shared purchasing, bookkeeping, hiring, maintenance, transport and portfolio research can economize through real centralized people and systems; they do not generate a free corporate-office bonus. Capital allocation, liquidity and skilled manager assignment remain late-game strategic problems.

CAN-CE1-13.4 Information is observer-dependent

Simulation truth, recorded facts, reputation from interactions, information held by a particular Person, rumor, inference and forecast are not identical. Who can know what depends on source, location, correspondence, observation, records, travel and communication time. A player's expertise may make better predictions, identify strong workers or notice financial problems, but it does not reveal unknown geology, hidden rivals or confidential household balances without credible evidence. Known transactions remain exact; uncertain appraisals and forecasts should carry uncertainty and date. Records and trained employees retain organizational memory when owners change, while knowledge can still be lost.

CAN-CE1-13.5 Commercial memory survives differently across its carriers

Personal memories, bilateral dealing experience, recorded accounts and procedural knowledge embodied in staff are different forms of commercial continuity. Losing a proprietor may eliminate personal knowledge without erasing signed records or long-serving workers; a new owner does not automatically erase local stories or inherited customer trust. A universal permanent reputation scalar is not the causal source.

Source trail: CAN XIV pp.298-300.

CAN-CE1-13.6 Awareness and reputational evidence are observer-dependent

A rumor, dated report, a witnessed failed delivery, a private account entry and an advertised claim do not convey identical knowledge or reliability. Player and NPC observers acquire evidence through permitted channels and only know information they plausibly received, subject to age, source and possible misunderstanding.

Source trail: CAN XIV pp.298-300; CAN XXIII information authority.

Principal source trail: CAN XXXI pp.4–5; CAN XXX pp.10–15; CAN XVII pp.157–201; CAN XIV pp.312–316, 335–337; Technical XIV pp.3–4.

Part XIV — Institutions, laws and intentional risk

CAN-CE1-14.1 Law is dated, located and specific

Legal regimes differ across Dakota Territory, South Dakota after statehood, federal jurisdiction, town/county institutions, private land interests and the institution's form. Interest limits, liquor trade, land entry, property tax, title transfer, security interests, medical/pharmacy authority, corporate powers, gambling, rail and public works can change with year and locality. A discovered law is part of institutional reality, not a universal ability unlocked by calendar progress. A legal-reference catalog later supplies dates, jurisdictions, sources and uncertainty while Canon retains these governing mechanics.

CAN-CE1-14.2 Possible, lawful and accepted are distinct questions

Some conduct is physically feasible but legally unauthorized; other conduct requires access, title or institutional powers to perform at all; still other conduct depends on the willing response of employees, sellers and counterparties. Existing Canon allows historically meaningful intentional illegality where action can physically and institutionally occur, with detection, records, enforcement, disputes and reputational effects arising through ordinary systems. This does not mean every illegal act is always performable or that fines and confiscation can occur without evidence, process and appropriate authority. Preserve the distinction pending careful Step 04 wording verification.

CAN-CE1-14.3 Institutions and civic investment

Courts, schools, public records, authorities, roads, crossings, utilities, fire/health responses, rail promotion and local government use actual budgets, duties, legal powers and people. Civic roles can be secondary service, elected/appointed offices or formal employment rather than entirely new worker species. A private enterprise cannot own municipal authority simply because it funds a public project; it may contract, lend, donate land, perform construction or receive authorized concessions. Government borrowing, public aid and regulated utilities depend on dated law and institutional capacity rather than TownLevel.

CAN-CE1-14.4 Indigenous people and the historical frontier

Indigenous polities and Persons are historically relevant actors and holders of rights, knowledge, lands, trade networks and relationships; they are not a generic hostile obstacle or a mechanic that disappears because settler population rises. Research community, era, jurisdiction, treaty/reservation context and geography before authoring a specific interaction. A scenario's historical skeleton does not let procedural land generation erase existing Indigenous interests, and markets can include lawful exchange and local expertise with proper provenance.

CAN-CE1-14.5 Illegal but physically possible actions

A physical production method, a lawful institutional authority, and another Person's willingness are separate questions. Where the period system supports attempted unlawful conduct, the player or an NPC may deliberately

attempt it without a hidden universal ban, and enforcement, contract invalidity, evidentiary consequences, risk, reputation and counterparties react through dated LegalRegime and ordinary world systems. This does not override genuinely impossible physical acts or automatically require staff cooperation.

Source trail: CAN XXX 5.7; CAN XXXI 1.4 and 3.1; TECH XIV preserved XIII legal distinctions.

Principal source trail: CAN XXXI pp.1–2, 5, 8; CAN XXX pp.15–16; CAN XXV pp.72–82; CAN XXIX pp.21–37; CAN XVII pp.202–208; CAN XIV pp.243–247, 253–259, 327–328.

Part XV — Environmental chronology, historical change and authored events

CAN-CE1-15.1 Historical timeline versus game causality

The normal historical window 1870–1905 includes actual federal/territorial/state law, major river and rail geography, outside markets and broad technological chronology. Historical facts may enter as immutable background, dated legal change, availability of routes/technology, information channels, or authored historically named events. They must not force a local railway, enterprise or town to appear if the simulated actor lacks finance, property rights or construction capacity. World and player actions can plausibly change local outcomes without rewriting the date that a federal law took effect.

CAN-CE1-15.2 Scenario Historical Events setting

Where named historical-event authoring is used, the Historical Events setting defaults ON. OFF prevents authored named events/regimes from injecting date-triggered causal inputs, and advanced scenarios may expose individual override controls. Turning it off does not eliminate recession, flood, drought, fire, disease, bank failure, crop failure or other endogenous outcomes from normal economic/physical rules. Settings persist with scenario/save state and never silently reverse transactions, deaths, projects or contracts after an event has taken effect.

CAN-CE1-15.3 Event influence uses real channels

The Panic of 1873 may tighten available credit, undermine banks or railway finance, postpone jobs/projects, change migration and shift demand; it must not directly post a blanket revenue penalty. A strong snow/ice season affects transport, animals, heating, work and stocks before prices respond. Similar reasoning governs grasshopper shocks, severe winters, railroad expansion, regional agricultural booms and later financial panics. Exact occurrence, geography, magnitude, duration, local exposure and cited historical evidence belong in the future Historical Timeline & Events reference, not as invented global constants in the core Canon.

CAN-CE1-15.4 Information and modernization

Technology and political change should be felt through people and markets: a telegraph connection changes the latency of intelligence, rail approaches change feasible markets and infrastructure needs, machinery changes work methods and consumables, and better record networks can change diligence. These developments do not create permanent, universal modernity buffs. Historical access may be early in a well-connected hub and late in an isolated settlement despite identical calendar dates.

Principal source trail: CAN XXXI pp.6–7; CAN XXV pp.72–82; CAN XXIX pp.21–37; CAN XIV pp.306–311, 328–329; Technical XIV p.6.

Part XVI — Scenarios, ownership predicates and trustworthy objectives

CAN-CE1-16.1 Scenario goals measure achievements

A scenario provides starting circumstances, particular time limits, victory/defeat rules and an observational objective list. It must not create buyers, independent entrepreneurs, housing occupants, deliveries, lenders,

construction resources or capital simply to ensure success. Difficulty arises from the actual opportunities, competitors, conditions and limits of the same underlying economic world. Scenarios may require hands-on first contract, later hired-labor work, actual new-building completion, independent contractors, portfolio scale, bank ownership, freight volume or lasting settlement condition without turning those targets into strategy permission gates.

CAN-CE1-16.2 Event, current and maintained predicates

A completed historical-event goal usually remains achieved even after the qualifying asset is sold, unless the authored goal explicitly requires continuing control or condition. A current ownership or operating goal must reevaluate at the time the objective specifies. Maintained employment, population, shareholding or service predicates must prove actual sustained intervals with persisted evidence, not signatures, rounded UI snapshots or invented narrative continuity. Independent NPC business goals must exclude disallowed player-owned affiliates; 50/50 partnership, wholly owned, majority-controlled and third-party ownership are distinct.

CAN-CE1-16.3 Valuation and financial objective precision

Scenario-defined owner equity states explicitly whether owner funds, share value, supplied starting assets, debt, mortgages, securities, personally owned horses/tack, business cash and real estate are included, and on what basis valuation is measured. Loan proceeds without associated liability reduction are not equity. Cost/book basis, appraised value and realized market proceeds must not be interchanged silently. Objective evidence should survive save/load and business sale when historical-event semantics require it; erroneous records need audit-proven reconciliation.

CAN-CE1-16.4 Playtesting is evidence, not new law

Saloon Circuit, Enterprise Ladder, The Contractor, The Market Town, The Crossing and other autonomous or human playtests can reveal rules, defects, credible strategies and missing information. Their generated prices, success timeline, budget, staffing, settlement counts or particular build path do not automatically become mandatory or universal. A scenario/test fixture belongs in a separate reference; the Canon preserves the general principle proven by the test. Narrative claims cannot overwrite unreconciled numbers.

Principal source trail: CAN XXXI pp.1, 7–9; CAN XXX pp.18–20; CAN XXII pp.108–112; CAN XXI pp.113–118; CAN XX pp.119–124; CAN XIV pp.240–252, 321–325.

Part XVII — Player interface, legibility and practical scope

CAN-CE1-17.1 A numbers-first, world-supported interface

Present actionable facts—cash, expenses, wages, debt, stock, available resources, contracts, construction progress, occupancy, demand evidence, opportunity risks—without forcing players into accounting or staffing micromanagement for every routine event. Important events should have a visible world correlate when observed locally: an actual customer enters, a shipment arrives, a worker travels or an asset is used. The UI compresses authoritative truth and should make distinctions such as total cash versus deployable cash, quantity on hand versus reserved, booked versus paid and owned versus leased intelligible.

CAN-CE1-17.2 Information honesty and forecast uncertainty

Display known exact figures precisely in appropriate units; do not manufacture numerical uncertainty around a posted invoice. Estimates, hidden skill, forecasts, property value, rival intent and market potential should indicate evidence quality. Explain the cause of a rejected action: missing workspace, stock, available worker, permission, route or legal standing—and keep undiscovered private information undisclosed. Alerts should prioritize

actionable exceptions, not every person movement or mundane business action. Reporting at portfolio scale should expose what managers decided and which items need owner attention.

CAN-CE1-17.3 Player freedom without busywork

Do not make players place every product on individual shelves, simulate each employee's minute-by-minute sleep or prescribe daily clerical rituals to earn a basic profit. Normalized allocation, standing orders, schedules, competent staff, coarse travel simulation and other abstractions are acceptable if they conserve physical resources, obey time and maintain meaningful choices. Do not make a real railroad dispatch simulator or an unrestricted modern finance simulator a prerequisite for a grounded frontier economy. Physical and social consequences should be rich, while navigation and feedback should remain approachable.

CAN-CE1-17.4 Different levels of responsibility remain fun

Manual owner labor is a viable early strategy; delegating operations should not be punished by hidden efficiency penalties, nor should the player be forced to retain a business forever after fulfilling a historical accomplishment. A more mature portfolio invites decisions about acquisitions, debt, reserves, development, equity, senior staff, competitors, freight and market positioning. Scenario setup, optional modes and UI workflows may vary, but the underlying commercial logic remains one coherent economy.

Principal source trail: CAN XXXI pp.1–8; CAN XVIII audit pp.157–201; CAN XIV pp.312–316, 331–345.

Part XVIII — Boundaries, historical references and retained holds

CAN-CE1-18.1 Specialist research moves, governing mechanics stay

A separate document may store 112 occupation profiles and workforce weights; another may store work-rate ranges and named 1870–1905 construction examples. A historical-timeline catalog should hold event chronology, evidence, geographic reach and uncertainty. A legal reference should hold dated statutory rules and land-rights specifics. An economy report should hold observations of wages, trade units, prices, materials and grades. Their findings support gameplay but cannot grant or remove Business capabilities. Moving research must preserve the cited source and original uncertainty; it never means deleting the underlying game rule.

CAN-CE1-18.2 Live issues are explicit

The distinction between feasible, legal and willingly performed needs exact phrasing approval. Finance-office-to-banking-house development is a historically plausible route, not a prescribed advancement ladder. Wage employment should retain one employment authority while family labor, owner labor and independent contracts remain properly distinguishable. The occupation report's 112 profiles are a proposed 1.0 catalog, not a proven immutable limit. Detailed legal powers and period economic numbers remain research holds. Whether actual Unity code complies requires an external repository audit, not the Canon text alone.

CAN-CE1-18.3 Formal scope of this draft

This document is a **substantive unified gameplay draft**, not the completion of the comprehensive no-loss audit. Rule references and historical details retained only as broad summaries still require paragraph-level comparison in Step 04. Nothing here changes the archived Canon XXXI, modifies Unity code, completes the Technical successor or promotes pending proposals 106–145. The next review should approve section direction and mark omissions/conflicts for verification.

CAN-CE1-18.4 Coverage and source-selection bias

Census employment and manufacturing tables, county histories, directories, newspapers and surviving contracts record selected observations, not a complete inventory of every wage worker, unpaid family contributor or enterprise. The historical occupation reference's model-derived weights are calibration priors, never compulsory town job quotas or evidence that everyone not gainfully employed was idle.

Source trail: OCC reference pp.1-2, 10-11; CAN XXXI calibration doctrine.

CAN-CE1-18.5 Provenance classes for evidence, estimates and rules

Maintain explicit distinctions among dated historical observations, retrospective sources, comparable-region analogues, model-derived synthesis envelopes, individual playtest numbers, optional scenario inputs and formally adopted canonical mechanics. Preserve the original date, geography, measurement unit, assumptions and uncertainty whenever transferring a numerical claim into a specialist reference.

Source trail: WORK reference pp.1-3,15-16; OCC pp.1-2,10; CAN XXXI 1.1.

Principal source trail: Canon XXXI all preserved layers pp.1–346; Technical XIV pp.1–170; occupation reference pp.1–18; historical work reference pp.1–18; Step 02 reconciliation crosswalk and decision holds.

Appendix A — Historical and technical material routed out of the active Canon

Existing material type	Future authoritative location for detail	Still retained in this Canon
Named panics, booms, dated incidents, measured historical exposure	REF-01 — Historical Timeline, Events & Economic Regimes	Causal-event, ON/OFF and non-omniscience rules, Part XV
Territory/state/federal laws, banking charters, homestead and Indigenous land chronology	REF-02 — Historical Law, Land Rights & Institutions	Legal/physical/rights distinctions, Parts V, XII, XIV
Occupation roster, 1900 census data, 1910 bridges, workforce weights	REF-03 — Occupation & Demography Calibration	Occupation-not-class, Person work and settlement/labor principles, Parts III–IV
Historical crew productivity, dates, worksites, construction observations	REF-04 — Historical Work & Construction	WorkPackages, clocks, resource concurrency, Part VI
Prices, wages, tariffs, unit rates, commodities, materials, grades	REF-05 — Historical Economy, Prices & Materials	Physical markets, real costs and price discovery, Parts VII, VIII, XI
Scenario tables, objective fixtures, playtest numbers and outcomes	DEV-01 — Scenario & Playtest Reference	Scenario/evidence doctrine, Part XVI
Conceptual data types, code ownership, migration, regression test detail	ACTIVE-02 — Consolidated Technical Bible	Expected gameplay behavior, throughout
Source-to-source override decisions, change status and unresolved questions	DEV-02 — Implementation & Decision Register	Approval and authority boundaries, this front matter

Appendix B — Supersession decisions already applied to the draft

Decision	Earlier wording at risk	Current intended interpretation	Source trail
B01	Spring 1880 is universal start	Spring 1870 normal Open Frontier start; later dates optional per scenario	CAN pp.72–82 supersede pp.240–245 / 317
B02	`BusinessType` and operation record grant actions	Generic identity with resources, rights, tasks and physical activity determining feasibility	CAN pp.1–3; TECH pp.1–2
B03	Workshop/occupation licenses recipes	ProductionMethod physical prerequisites, competence affects result	CAN p.3; TECH pp.2–3

B04	Slot or roster defines employment	Real employment and work relationships; workload generates required tasks	CAN pp.178–193; TECH preserved VIII/VI layers
B05	Population multiplier directly posts sales	Persons and transactions create actual demand, workload and revenue	CAN pp.95–107; TECH pp.70–80
B06	`TownLevel` unlocks institutions	Settlement roles describe actual economy and infrastructure	CAN pp.72–82; TECH preserved VIII
B07	Constructed track is operating rail	Rights, work, facilities and actual rail service remain separate	CAN pp.72–82; TECH preserved VIII
B08	Bank progresses through hard tiers	Financial capabilities composable; genuine dated legal institution types still distinct	CAN pp.14–16, 113–118
B09	Universal credit/reputation/business health bar	Relationship evidence and actual funds, liabilities and market alternatives	CAN pp.157–201; CAN pp.302–305
B10	Historical events always fire	Configurable authored historical injection; endogenous events continue	CAN pp.6–7; TECH p.6
B11	Scenario objectives create qualifying state	Objectives only observe real actor, asset, equity and completed-work evidence	CAN p.7; TECH pp.6–7
B12	Project price/timing observed once becomes a rule	Historical observations remain bounded evidence with local scope	CAN p.2; WORK pp.2–16

Appendix C — Step 02 open issues retained for explicit review

D-01 (decision): Wording for unlawful-but-possible activity—existing Canon supports consequence-bearing illegality; no expansion of unapproved proposal 106 is implied.

D-02 (decision): Finance office → bank is a possible historical pathway, not a prerequisite.

D-03 (decision): EmploymentRelationship should not absorb independent owner/family/contractor arrangements as wage employment.

D-04 (decision): Status of 112 profiles as 1.0 design target versus nonexclusive reference remains to be explicitly confirmed.

D-05 (research/implementation hold): Technical XIV identifies a blocked-shipment duplication defect; no evidence of repair is asserted here.

D-06 (gate): Do not delete older source text until Step 04 proves no-loss trace.

D-07 (gate): Historical Events ON/OFF applies only to authored event injection, not federal law, geography, statehood or endogenous incidents.

D-08 (research): 1900 and 1910 demographic observations must not be converted to 1870 hard world-generation ratios.

D-09 (research): Occupation and work report front-matter references older editions; compatibility updates occur at Steps 10 and 11.

D-10 (gate): Proposals 106–145 remain pending; overlapping existing Canon still stands on its earlier provenance.

D-11 (research): Legal bank/land powers require year, jurisdiction and source-specific verification in REF-02.

D-12 (implementation): A planning target is not proof of an implemented Unity code path.

Appendix D — Approved change mapping (proposals 001–105)

This appendix is an **index of the already-approved proposals**, not their original full wording. It shows where the Step 03 draft addresses each design direction; explicit source-by-source verification and correction of any missing nuance occur in Step 04. References xx.y resolve to CAN-CE1-xx.y sections above. The pending 106–145 proposals are intentionally omitted.

#	Approved proposal topic	Draft section(s)
001	Remove BusinessType action permissions	CAN-CE1-02.1
002	Operations and capability registries are descriptive	CAN-CE1-02.1
003	Trade identities are inferred labels or templates	CAN-CE1-02.1
004	Templates materialize ordinary economic state	CAN-CE1-02.1
005	Operating state derives from executable activity	CAN-CE1-02.2
006	One Business combines compatible activities	CAN-CE1-02.1, CAN-CE1-02.2
007	Opportunity starts from unmet needs and capacity gaps	CAN-CE1-11.3
008	Incumbent expansion competes with new formation	CAN-CE1-11.3
009	Multiple causal responses to an unmet need	CAN-CE1-11.3
010	NPC startup assembles actual venture inputs	CAN-CE1-11.2, CAN-CE1-02.1
011	No balance-mandated rival spawning	CAN-CE1-11.2
012	Retail offer is stock, price, channel and capacity	CAN-CE1-07.1
013	No merchandise whitelist by business identity	CAN-CE1-07.1
014	Merchandise categories describe actual assortment	CAN-CE1-07.1
015	Retail is not restricted to a storefront	CAN-CE1-07.1, CAN-CE1-05.2
016	Services arise from actually available capacity	CAN-CE1-02.1, CAN-CE1-09.1
017	Mixed activities cannot duplicate capacity	CAN-CE1-02.1, CAN-CE1-06.2
018	Change, pivot or close from economics and agency	CAN-CE1-02.2, CAN-CE1-11.4
019	No automatic closure from fixed negative-profit timer	CAN-CE1-11.4, CAN-CE1-12.6
020	Acquired businesses retain inherited operating problems	CAN-CE1-05.3, CAN-CE1-02.3
021	Enterprise grouping is not a merger	CAN-CE1-02.3
022	Occupation is descriptive rather than a class	CAN-CE1-03.2
023	People can perform secondary and seasonal work	CAN-CE1-03.2, CAN-CE1-03.4
024	Ordinary task attempts depend on method, not occupation	CAN-CE1-03.2, CAN-CE1-06.1
025	True physical/legal specialist	CAN-CE1-03.2, CAN-CE1-14.2

	prerequisites remain	
026	EmploymentRelationship one wage-employment authority	CAN-CE1-03.4, CAN-CE1-18.2
027	Real workload drives staffing	CAN-CE1-03.4
028	One Person may serve multiple compatible functions	CAN-CE1-03.4
029	Family work counts as actual labor	CAN-CE1-03.4
030	Portfolio labor may be assigned across businesses	CAN-CE1-03.4, CAN-CE1-13.1
031	Manager title expresses authority, not a tier	CAN-CE1-13.1
032	Manager quality arises from decisions	CAN-CE1-13.2
033	No universal Morale causal bar	CAN-CE1-03.6
034	Labor pressure is derived evidence	CAN-CE1-03.5, CAN-CE1-11.3
035	FunctionalSpace features are not a new type gate	CAN-CE1-05.2
036	UseRelationship and physical conversion govern room use	CAN-CE1-05.2
037	No universal commercial/residential permission class	CAN-CE1-05.2
038	Conversion demands actual work where needed	CAN-CE1-05.2, CAN-CE1-06.4
039	Multiuse, multitenant premises are normal	CAN-CE1-05.2
040	Business can occupy multiple sites	CAN-CE1-02.1, CAN-CE1-05.2
041	Accommodation categories are arrangements, not tiers	CAN-CE1-04.2
042	Housing suitability is household- and season-specific	CAN-CE1-04.2
043	Crowding creates consequences, not a simple wall	CAN-CE1-04.2
044	Rent is an agreement rather than a floating price	CAN-CE1-04.2
045	Real property leads rather than omniscient for-sale pool	CAN-CE1-05.3
046	Seller willingness must remain meaningful	CAN-CE1-05.3
047	No TownLevel permission architecture	CAN-CE1-05.1, CAN-CE1-11.1
048	Settlement roles describe history/economic position	CAN-CE1-05.1, CAN-CE1-11.1
049	Institutional openings depend on real feasibility	CAN-CE1-05.1, CAN-CE1-14.3
050	Distinguish resident, transient, worker and catchment counts	CAN-CE1-04.3, CAN-CE1-11.1
051	Catchments derive from travel and economic links	CAN-CE1-11.1
052	Population does not mechanically post profit	CAN-CE1-11.1, CAN-CE1-07.4
053	Demand intent is not automatic business revenue	CAN-CE1-07.4, CAN-CE1-11.1
054	Local purchases and services consume Person/labor capacity	CAN-CE1-03.1, CAN-CE1-07.4
055	Queues/stockouts/workloads drive	CAN-CE1-11.3

	expansion demand	
056	Opportunity reports include known pipeline responses	CAN-CE1-11.3
057	Oversupply distinct from shortage resolution	CAN-CE1-11.3, CAN-CE1-11.4
058	Multiple investors can create genuine overbuilding	CAN-CE1-11.4
059	NPC rivals use ordinary player-equivalent systems	CAN-CE1-11.2
060	Competitor plans require credible information	CAN-CE1-13.4, CAN-CE1-11.2
061	Commercial standing depends on relationship memory	CAN-CE1-13.4, CAN-CE1-11.2
062	Advertising changes awareness, not raw profit modifiers	CAN-CE1-13.4, CAN-CE1-11.3
063	ProductionMethod governs methods rather than shop recipe lists	CAN-CE1-06.1
064	Reserve physical resources once across all domains	CAN-CE1-06.1, CAN-CE1-06.2, CAN-CE1-10.1
065	Inventory uses actual storage/display capacity	CAN-CE1-07.3
066	Perishable lot provenance and processing continuity	CAN-CE1-07.3, CAN-CE1-09.3
067	Supplier-first procurement with real terms	CAN-CE1-07.2
068	Supply agreements cannot generate stock	CAN-CE1-07.2, CAN-CE1-07.4
069	Backup suppliers, subcontracting and overbooking retain risk	CAN-CE1-07.2, CAN-CE1-10.2
070	Transport services compose across ordinary assets	CAN-CE1-10.1, CAN-CE1-10.4
071	Route infrastructure and operated service differ	CAN-CE1-10.1, CAN-CE1-10.3
072	Warehouse needs real physical space and handling	CAN-CE1-10.2
073	Construction time derives from WorkPackages	CAN-CE1-06.4, CAN-CE1-06.5
074	Contractor qualification is evidence-based, not level-based	CAN-CE1-06.4
075	Crews use real Person assignments and time	CAN-CE1-06.4, CAN-CE1-06.5
076	Technology is access/supportability, not universal unlock	CAN-CE1-10.5
077	Asset condition includes domain-specific defects	CAN-CE1-06.3
078	Maintenance/failure creates real corrective consequences	CAN-CE1-06.3
079	Financial service mix is composable	CAN-CE1-12.1
080	Genuine legal bank forms remain distinct	CAN-CE1-12.1, CAN-CE1-14.1
081	Underwriting is evidence-based, not CreditScore	CAN-CE1-12.2
082	Bank safety derives from assets/liabilities and policy	CAN-CE1-12.5

083	Reserves are classifications, not duplicate cash	CAN-CE1-02.3, CAN-CE1-12.5
084	Shared Agreement/Obligation grammar	CAN-CE1-02.5, CAN-CE1-07.4
085	Distinct property, security, employment and service rights	CAN-CE1-02.5, CAN-CE1-05.2
086	Subsidiary and minority entities remain separate	CAN-CE1-02.3, CAN-CE1-12.3
087	Actual transfer/consent required for merger	CAN-CE1-02.3
088	Corporate funds subject to governance and shareholder rights	CAN-CE1-12.3
089	Distress means declining real options, not health meter	CAN-CE1-12.6, CAN-CE1-11.4
090	Default/foreclosure/bankruptcy are persistent workflows	CAN-CE1-12.6
091	Recruit from contactable real Persons	CAN-CE1-03.5
092	Information retains source/date/observer/confidence	CAN-CE1-13.4
093	Migration has awareness, feasibility, travel, residence stages	CAN-CE1-04.3
094	Generate people and kin before synthetic households	CAN-CE1-04.1
095	Age transitions do not automatically create life events	CAN-CE1-04.1, CAN-CE1-03.1
096	Population changes follow Person/residence events	CAN-CE1-04.1, CAN-CE1-04.3
097	Continuous clock and scheduling remain authoritative	CAN-CE1-03.4, CAN-CE1-06.1
098	Owner attention emerges from management load	CAN-CE1-13.1, CAN-CE1-13.3
099	Dashboards and scores are read models	CAN-CE1-02.4, CAN-CE1-17.1
100	Scenario objectives observe, never manufacture	CAN-CE1-16.1
101	Historical events inject causes, not arbitrary percentage results	CAN-CE1-15.3
102	Scenario/settlement profiles are priors, not fixed rosters	CAN-CE1-05.1, CAN-CE1-11.1
103	Off-map movement and economy preserve identity and truth	CAN-CE1-03.1, CAN-CE1-10.1
104	Local physical presentation must match real event	CAN-CE1-10.2, CAN-CE1-17.1
105	Industries reuse common Person/Task/Asset/Agreement systems	CAN-CE1-09.1, CAN-CE1-06.1

Appendix E — Step 03 acceptance checklist and next gate

- [x] Consolidated outline organized by gameplay subject rather than revision chronology.
- [x] Draft covers general Business identity, production, workforce, households, property, markets, supply, transport, finance, delegation, legal context, historical events, scenarios and UI.
- [x] Newer spring-1870 opening overrides earlier spring-1880 text.
- [x] Source page trails and curated Step 02 supersession decisions retained.
- [x] Historical data moved **by routing designation only**; original references and PDFs unchanged.

- [x] Pending proposal set 106–145 has not been independently enacted.
- [ ] **Step 04:** Paragraph-by-paragraph no-loss coverage verification of the cumulative Canon XXXI source.
- [ ] **Step 04:** User-approved resolution of the D-01–D-04 wording/role questions.
- [ ] **Step 04:** User signs off final Canon replacement edition.

STOP. This document concludes Step 03. Do not begin Step 04 without user acceptance of the draft and its explicitly stated limits.
